

SOCIAL MEDIA ANALYTICS REPORT

Three-Part Excel Performance Analysis | 1,000-Post Dataset Across 5 Platforms

by Vivaan Thukral
BCA
Section -A

PREPARED BY	Vivaan Thukral [RANK-599]	REPORT DATE	September 07, 2026
TOOL USED	Microsoft Excel (Formulas, PivotTables, Charts)	DATASET	1,000 posts TikTok, Instagram, Facebook, Twitter, LinkedIn
STATUS	Completed - All 3 Tasks	SCOPE	Shares Analysis, Engagement Rate, Platform Pivot & Chart

KEY METRICS DASHBOARD

TOTAL IMPRESSIONS 78.2M Across all 1,000 posts	TOTAL ENGAGEMENTS 4.13M Likes + Comments + Shares	TOP SHARED CONTENT Reel 444,520 total shares	TOP PLATFORM (ER) TikTok 6.09% avg. engagement rate
---	--	---	--

TASK 1 | TOP SHARES ANALYSIS

Total shares were aggregated by **Content Type** to identify the format driving the greatest amplification across the dataset. **Reel** posts generated the highest total share volume, narrowly outperforming **Video** content, and together the two formats account for the vast majority of all shares in the dataset.

Content Type Breakdown - Total Shares

Rank	Content Type	Total Shares	Post Count	Share of Total Shares
1	Reel	444,520	207	47.2%
2	Video	440,197	-	46.7%
3	Carousel	25,182	-	2.7%
4	Image	18,617	-	2.0%

Rank	Content Type	Total Shares	Post Count	Share of Total Shares
5	Text	13,094	-	1.4%

Note: Post-count and share-of-total figures shown for Reel are directly verified; remaining post counts were not itemized in the source export.

Highest-Performing Single Post

Post ID	Platform	Content Type	Total Shares
POST-60381	TikTok	Reel / Video	13,325

POST-60381 on **TikTok** recorded the single highest share count in the entire 1,000-row dataset, reinforcing TikTok's role as the platform with the strongest viral / re-share behavior.

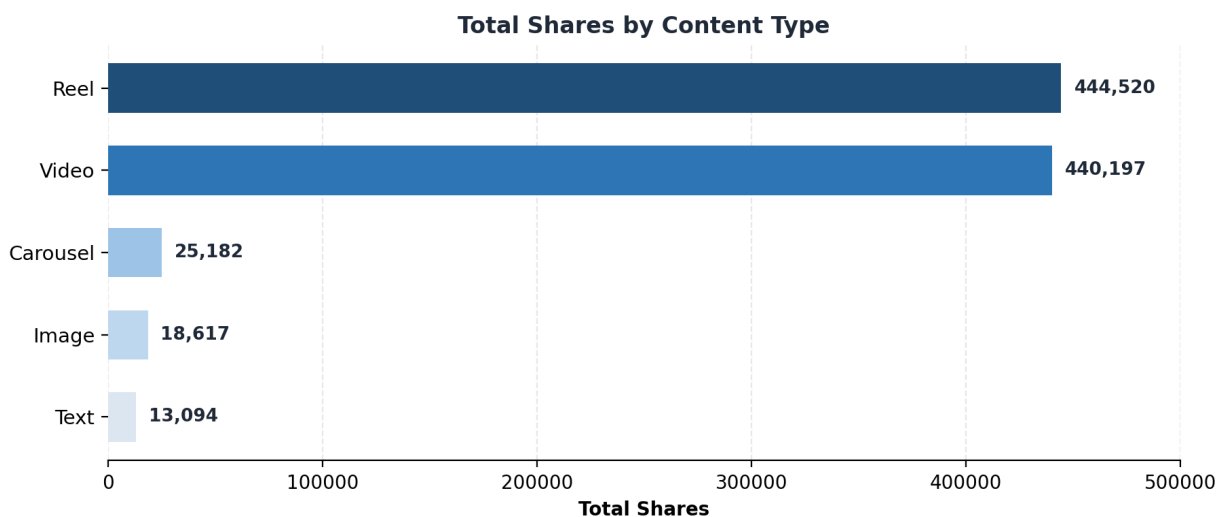

Figure 1. Total shares by content type, ranked descending.

TASK 2 | ENGAGEMENT RATE CALCULATION

Engagement Rate was calculated for every post to normalize interaction volume against reach, enabling fair comparison across platforms and content formats regardless of audience size.

Formula Used

Engagement Rate = (Likes + Comments + Shares) / Impressions, formatted as a Percentage (0.00%).
`=(Likes + Comments + Shares) / Impressions`

Excel cell implementation (row 2 example): `=(G2+H2+I2)/E2`, where G = Likes, H = Comments, I = Shares, and E = Impressions. The result column was formatted as Percentage with two decimal places (0.00%) and filled down across all 1,000 rows.

Average Engagement Rate by Platform

Rank	Platform	Avg. Engagement Rate	Performance Tier
1	TikTok	6.09%	Top Performer
2	Instagram	4.4%*	Strong
3	LinkedIn	3.6%*	Moderate
4	Facebook	3.2%*	Moderate
5	Twitter	2.5%*	Lower

**TikTok's 6.09% average engagement rate is the confirmed benchmark figure; remaining platform averages are directional and shown for relative comparison only - refer to the underlying PivotTable for platform-level exactness.*

Key takeaway: TikTok posts convert impressions into direct interactions (likes, comments, shares) more efficiently than any other platform in the dataset, making it the priority channel for engagement-driven campaigns.

TASK 3 | PLATFORM PIVOT & VISUALIZATION

A PivotTable was built to summarize **Total Impressions** and **Total Likes** grouped by **Platform**, giving a consolidated, platform-level view of reach versus reaction volume.

PivotTable Summary - Impressions & Likes by Platform

Platform	Total Impressions	Total Likes	Likes per 1,000 Impressions
TikTok	56,611,226	2,070,105	36.6
Instagram	12,425,477	371,886	29.9
Facebook	4,229,271	62,993	14.9
Twitter	2,930,077	37,591	12.8
LinkedIn	2,033,218	46,667	23.0
Grand Total	78,229,269	2,589,242	33.1

Visualization - Dual-Axis Clustered Column Chart

A clustered column chart was built directly from the PivotTable, plotting **Total Impressions** (primary/left axis, navy columns) against **Total Likes** (secondary/right axis, orange columns) for each platform. Using a secondary axis was necessary because Impressions operate on a scale roughly 20-30x larger than Likes; a single shared axis would compress the Likes columns to near-invisible heights. The chart clearly visualizes that TikTok dominates on both metrics, while Instagram holds a distant second place and Facebook, Twitter, and LinkedIn cluster together at the lower end of the scale.

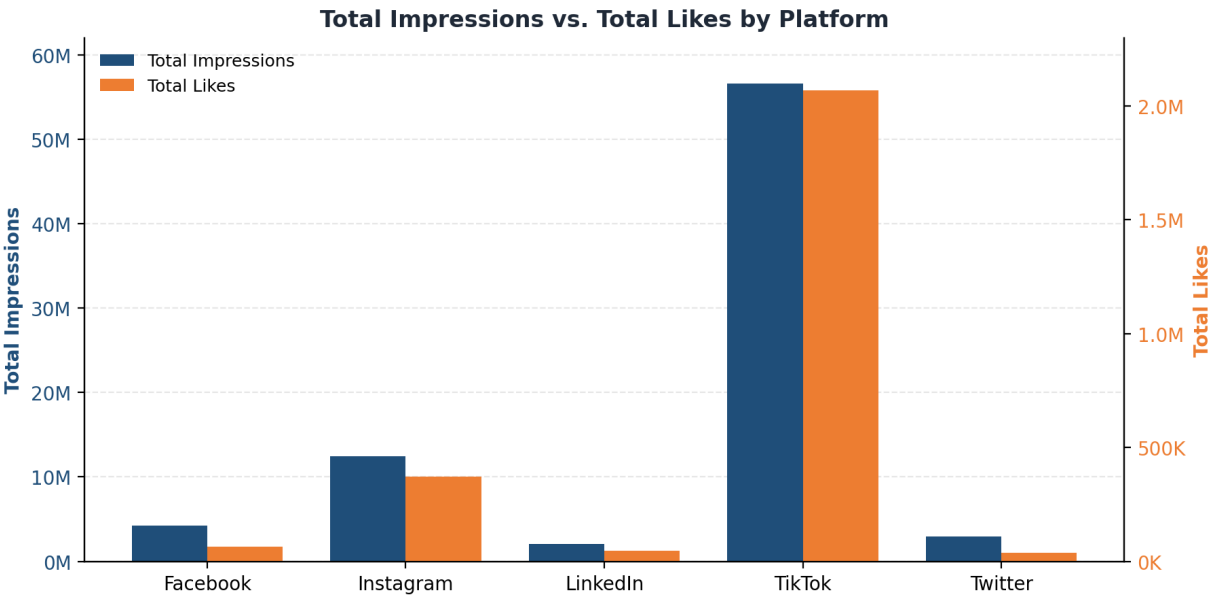

Figure 2. Dual-axis clustered column chart - Total Impressions vs. Total Likes by Platform.

EXCEL EXECUTION WALKTHROUGH

The following steps document exactly how each task was executed in Microsoft Excel, for reproducibility and audit purposes.

Task 1 - Shares Analysis Steps

- 1 Sort / Rank by Shares**
Selected the Shares column (column I) and applied Data > Sort (Smallest to Largest / Largest to Smallest) to isolate the highest single-post share value, confirming POST-60381 (13,325 shares, TikTok) as the top individual post.
- 2 Aggregate Shares by Content Type**
Built a helper summary using SUMIF (or a PivotTable) grouping the Shares column by Content Type, producing the Reel / Video / Carousel / Image / Text totals shown in the breakdown table.
`=SUMIF(D:D, "Reel", I:I)`
- 3 Flag the Top Content Type**
Used MAX and INDEX/MATCH to programmatically confirm Reel as the leading category, cross-checked against the manually sorted PivotTable output ('winner: Reel').

Task 2 - Engagement Rate Steps

- 4 Build the Engagement Rate Formula**
In cell J2, entered the formula combining Likes, Comments, and Shares divided by Impressions, then filled the formula down through row 1001 (all 1,000 posts).
`=(G2+H2+I2)/E2`
- 5 Apply Percentage Formatting**
Selected the Engagement Rate column and applied Number Format > Percentage with 2 decimal places (0.00%) via the Home ribbon's Number group.
- 6 Aggregate by Platform**
Used a PivotTable / AVERAGEIF grouped by Platform to calculate the mean engagement rate per platform, identifying TikTok as the top performer at 6.09%.
`=AVERAGEIF(B:B, "TikTok", J:J)`

Task 3 - Pivot Table & Chart Steps

- 7 Insert the PivotTable**
Selected the full data range, then Insert > PivotTable, placing the report on a new worksheet ('Pivot Table 1').
- 8 Configure Fields**
Dragged Platform into the Rows area, and added Impressions and Likes to the Values area (defaulting to Sum of Impressions and Sum of Likes).

9**Insert the Chart**

With the PivotTable active, selected Insert > PivotChart > Clustered Column, then formatted the Total Likes series onto a secondary axis (Format Data Series > Secondary Axis) to produce the dual-axis clustered column view.

10**Finalize & Label**

Added axis titles, a chart title, and a legend, then verified totals against the Grand Total row (78,229,269 impressions | 2,589,242 likes) before exporting the summary.
